

Learn with your AI

Use AI to understand AI. Then build something that helps you learn.

Week 6 · Learn, Vibe, Build · October 5, 2026

Your AI can help you learn about AI

- Ask for an explanation at your level.
- Ask it to quiz you, then explain what you missed.
- Check its claims against the material you gave it.

This week's reading: your AI as a coach

- Arielle Shipper · How to Get Better at AI by Asking AI
- Use examples of your own work to ask: "What should I learn next?"
- Then: "Teach me that next step."

Markdown is just a text file

- A .md file is plain text, with headings and lists.
- You can read it. Your AI can read it.
- A lesson or project context can live in that file.

Context that sticks

- Claude Code loads CLAUDE.md at session start.
- Cursor and other coding tools can load AGENTS.md.
- In a chat app: paste the file or add it to a Project.

One small example

```
# Hill Plant Swap  
A one-page website for a free plant swap  
near CU.  
For first-year students who are nervous  
about going.  
Keep it plain HTML and CSS. No JavaScript.  
Use docs/event-facts.md. Never make up  
dates.
```

Plain words. Nothing fancy.

A link someone else can open

- `file://` and `localhost` links only work on your computer.
- A public HTTPS link works on someone else's phone.
- Commit → push → deploy are three different steps.

The short path online

- GitHub Desktop: create repo → commit → publish.
- GitHub: Settings → Pages → main / root → Save.
- Open the published link on another phone.

Next week: your AI reaches your tools

- API: one program asking another for something.
- Connector: your AI reaches tools directly, instead of you pasting.
- This week we copy. Next week we'll connect.

Everything you need is on the Week 6 page

- `cu.learnvibe.build` → Everything for Week 6
- Click “Copy lesson as markdown” → paste into your AI.
- Ask: “Teach me this and quiz me.”

One live conversation with Claude

- Copy the lesson markdown into Claude.
- Talk through what you want to understand.
- Maybe ask Claude to build a little thing from that conversation.

In small groups: build something that helps you learn

- Choose your own topic and approach.
- Try a quiz, interactive explainer, practice tool—or your own idea.
- Use your AI, test what you build, and show what it helped you learn.

Start with a learning question

- What do you want to understand or practise?
- Give your AI the lesson, your question, or both.
- Build a small first version; try it and revise.
